FEATURE	EXPLANATION
Digital Noise Reduction	A digital noise algorithm that is able to remove the repetitive background noise of your environment, to ensure only the clear details of your voice reaches the final output signal.
Sound Focus Beaming Technology	A digital noise reduction algorithm that adapts the width of the microphone pickup pattern to cancel out all ambient noise to ensure only the desired sound source reaches the final output signal. This eliminates the need for a headset boom microphone.
Sound Focus Direction Control	Lets you manually adjusts the focus point toward your desired sound source.
Output Acoustic Noise Cancellation	Removes noise from the audio you receive.
Echo Cancellation (Windows Only)	Digitally cancels the echo from the speakers so the output signal is not picked up by your microphone input.
Graphic EQ with Presets	10-band graphic EQ lets you customize the received audio to match your desired preferences.
Digital Recorder	Lets you record meetings, conversations or music and easily export them as saved media files, or email them as needed.
